

febi bilstein - always at the right level

Levelling valves are essential components in the cabin air suspension. Its intelligent control system ensures that the cabin is always held at the correct height, and ensuring driver comfort over changing terrains and road conditions.

Reasons for possible failures include air leaks resulting in loss of pressure in the compressed air system neglected maintenance schedules can affect the function of the system as oil residue can “clog” the small valves within the housing, and in the winter months possible problems due to moisture in the systems freezing due to the air drier failing. If any of the above occur other components could be damaged (ie Cab shock, link rod, ball joints and bushes).

febi bilstein offers a wide range of suspension level valves for cabs.

e.g. febi no. 39335

to fit:
Volvo Trucks B10M, FH, FH12, FH12 (BR),
F10, F12, F16, FL6, FL12, FL608-615, NL12,
NH12, NH12 (BR)

Repl. no. 1607728

Subject to technical changes
