

OE Design

SMPE Design

You will notice the design of the SMPE manufactured exhaust pressure sensor differs from the original unit. The OE design uses a ceramic capacitive device which is prone to early life failure and is less accurate than the modern electronic pressure sensor used in our re-designed unit. We were able to repackage the electronic sensor and attach it to a mounting bracket, ensuring the same footprint as the original design

Although the orientation of the outlet pipes has been rotated through 90 degrees, the diameters of the pipes have been retained, so you will encounter no problems fitting the original mating pipes to our unit. The colour coding in the above diagram helps you to fit the mating pipes correctly
